Asking Photoshop to heal The Content-Aware (Smart) Healing tool is a useful addition to your arsenal. If you want to eliminate minor defects in your image, but don't want to ruin your original art, the Content-Aware (Smart) Healing tool is a good substitute. As Figure 2-9 shows, the Smart Healing tool is a small arrowhead tool that, when positioned over the offending area, shows you the thumbnail of the best selection from any of the other tools (such as the Burn or Dodge) on your screen. You then use the arrow on the right of the tool to select the appropriate source. If the thumbnail is not visible, you can hover over the portion of the image you want to use as a source. Then simply drag the Smart Healing tool to the area you want to use and release it. Figure 2-10 shows the image after using this tool on the spot of a hair that was too short. Photo by Andy Dismore

During the operation of a typical dynamoelectric machine such as an electric machine, magnetic flux flows through the machine as the magnetic flux of the stator passes through gaps in the teeth of the stator. The flux causes current to flow through the machine and may cause eddy currents to flow within material of the machine. In operation, an AC current flows in the armature winding of the machine and, during the operation of the machine, eddy currents are induced in the steel of the machine. These induced eddy currents may be of two types, natural and thermal. Natural eddy currents are caused by the passage of the magnetic field through the machine or by eddy currents induced on the rotor of the machine. Thermal eddy currents are caused by the energy dissipated in the machine. Various methods of reducing the eddy currents induced in a machine have been tried, including shielding techniques. Shielding techniques involve surrounding an area on which the magnetic flux of the machine is to be induced with a shielding enclosure or casing. The enclosure is typically made of non-conductive material. Eddy current detection involves the measurement of the current induced by the magnetic flux of the machine. The magnetic flux of the machine induces currents in an area of the machine that is defined by the gap between two teeth or in an area of the machine that is defined by the gap in a tooth between two teeth. The flux density in the machine is dependent upon the gap, the length of the machine, and the characteristics of the material that constitutes the machine. The area of the machine defined by the gap is called a flux-defining area. The flux-defining area is the area of a machine from which eddy currents are induced in the machine. The size of the flux-defining area is important in determining how effectively an eddy current detection system can measure the currents induced in the machine. The flux-defining area is calculated from the flux in the flux-defining area and the length of the machine. Induced currents are measured in the flux-defining area and the magnitude of the induced currents is compared to a threshold level. If the magnitude of the current induced in the flux-defining area is larger than the threshold level, the machine is determined to be operating under abnormal conditions and the machine operator is warned. Induced currents are measured when the machine is disconnected from a power source. A voltage across the stator armature is caused by the difference in the magnetic flux that passes through the stator

First, that people who make music and sing want to be famous. Second, that they will do something about it. They don't. As with most things in life, there are a few exceptions that you know about, but really, most of us don't give this much thought. So why would we try to get
