My question is: 1) Which are the best approaches for the spellchecker? 2) Should I use a dictionary? If yes, which one? 3) If I'm going to use a dictionary, how should I organize it in my application? Is it enough to store words in a file? How many words are usually stored in a dictionary? Thank you very much for your replies. A: Answers Regarding the approach: it is important to note that your program will need to make a judgement call based on whether the word is commonly misspelled or commonly badly spelled. This question alone is worth a book. My personal preference is a content based filtering approach, where words are checked against the database of common mistakes, and a word is presented to the user if it is common in a way that should be made obvious to the user that a mistake has been made. The

business of the dictionary is up to you, personally I think it is common practice to store the words in a file with line breaks to reduce the size, but ultimately it is your choice. I would personally store a minimum of 100,000 words. This will generally be the number of common words in a decent size dictionary. You can see that question for more discussion on the matter. The way to go I would personally do the following: Use the Levenshtein distance algorithm to determine if a word is commonly misspelled or commonly badly spelled. When determining what words are commonly misspelled or commonly badly spelled, you can automatically ca3bfb1094
