Searching in a nonlinear editing software program The most important tool in your nonlinear editing software bag is the search tool. Whether you're using Adobe Premiere, Adobe After Effects, or Sony Vegas, the search tool is the heart of nonlinear editing: It's the means by which you find what you're looking for in your editing timeline. To begin a search, press the Search key on your keyboard. You see a cursor appear at the top of the program's window. In Adobe After Effects, it's the little yellow circle with the white curved arrow (see Figure 4-17). **Figure 4-17:** In Adobe After Effects, the search tool is the little yellow circle with the white curved arrow. |

The documents include details on the Moscow bombing that claimed the lives of 17 innocent people, including a well-known Russian oligarch. The leakage of this information will be seen as clearly politically-motivated, as the documents relate to the investigation into the alleged attempt to assassinate an ex-Russian spy. Research in neuropsychiatry II: substance-induced psychosis. Substance-induced psychosis (SIP) consists of a subset of schizophrenic symptoms attributable to the use of drugs. SIP is a major issue within the field of neuropsychiatry and it is widely held that this is a disorder best characterized by negative symptoms rather than positive. There have been only a handful of fMRI studies in this area. To identify an effect of substance use in the fMRI blood-oxygenation-level-dependent (BOLD) signal and pattern of functional connectivity. We performed a literature search for fMRI studies of substance-induced schizophrenia and psychotic symptoms. We used thematic analysis to interpret the results of the identified studies. We identified five fMRI studies in this area and included four: one of cocaine, one of amphetamine, one of cannabis, and one of nicotine. All studies recruited patients with schizophrenia. With the exception of one study, all patients in the studies were taking antipsychotic medication. The studies have generally failed to find evidence for effects of drugs on the BOLD or connectivity of the fMRI signal. Most investigators have concluded that there is no primary effect of drugs in the brain, but rather the effects that drugs can have on the disease process are secondary to the effects of antipsychotic medications. These results are discussed in the context of the broader literature on this topic and the potential effect of confounding factors./* * Copyright (C) 2011 Google Inc.
