Song :- Ki Diya Film :- Khiladi starring . This was last year before I got on my third trip to Pakistan. I was staying in Kanpur (Punjab) and I wanted to watch Khiladi movie. I was so glad. I enjoyed the movie and I couldn't wait for me to go home and watch the movie on YouTube. I started doing this as I

can see it on youtube. I only did it because I wanted to see how they do it. And I learned a lot of things about Pakistani films .

The film stars Ayub Jahan as Inspector Notty K and Arpita Ganguly as Inspector Jishu.. Watch the movie Khiladi 786 with English sub and other nine languages HD (High Definition) for free on. There are two basic types of electro-acoustic transducers, namely active and passive. An active transducer is an electro-acoustic converter comprising a voltage source for delivering electrical signals to excite the

transducer which is usually a loudspeaker. An example of an active transducer is a loudspeaker. In contrast, a passive transducer can take the form of a microphone. Typically, an active transducer is employed for delivering audio signals at high sound pressure levels but for only short periods of time whereas a passive transducer is used for delivering audio signals of longer duration at lower sound pressure levels but requiring less energy. Thus, transducers of the passive type are typically more energy efficient and are also cheaper and easier to manufacture. For purposes of amplification, a passive transducer is generally connected to a low-impedance load

such as a low-impedance speaker.

The source to load impedance mismatch between the passive transducer and the low-impedance speaker is compensated for by an impedance transformer. In a prior art impedance transformer, a dedicated transformer design is used wherein the source
