For example, an article by N. D. Gartrell and J. Leith "Tree Cover Isolation Using U and V" in a publication of the American Society for Photogrammetry and Remote Sensing, 30th Annual International Technical Meeting, March 1998, describes a method of separating vegetation patches from terrain. It is stated that by isolating vegetation patches from terrain, a signal is generated in a restricted portion of the image. U.S. Pat. No. 4,398,038 describes a method for removing unwanted colors from an image of a scene. U.S. Pat. No. 5,016,438 discloses the use of a technique for separating terrain and vegetation information from an image. This technique uses a ratio of a signal from U band and V band. The ratio is processed through various computations to produce an output which is used to set an image threshold. U.S. Pat. No. 6,697,740 describes a color image enhancement method which uses contrast and correlation measurements to enhance color images. S. P. Thorpe, "Simultaneous RGB Color Discrimination: A Comparison of Discrete Optical Cone Model and Ideal Observer Performance", IEEE Transactions on Pattern Analysis and Machine Intelligence, Vol. 20, No. 9, pages 881-892, September 1998 describes a method for distinguishing between colors of terrain and colors of vegetation. This method detects the ratio of a red to blue pixel and a green to blue pixel. European Patent Application Publication No. 0 805 223 A1 describes a method for distinguishing between terrain and vegetation in a color image. 0.037
