This invention relates to a technique for facilitating multiple access to a communication medium by a number of devices. One of the significant difficulties with the development of such a communication medium, for instance, a communication satellite, is the need to make such medium available not only in a limited number of locations, but also to a large number of individual users in a wide geographical area. The transmission capabilities of a satellite are limited both by the antenna size and the required communications bandwidth. Furthermore, the satellite must be capable of being moved relatively quickly and moved from one location to another. In a known multiple access technique, the frequency-based, time-division multiple access (FDMA) method, a communication medium is divided into a number of frequency bands. Communication traffic in each frequency band is handled by a corresponding individual frequency carrier. A specific time slot in the overall communication cycle is assigned to each user, which time slot is occupied by the user during a defined interval of time. The frequency carrier of a user is only active during the user"'s assigned time slot. However, the FDMA technique requires that the number of users be equal to the number of defined frequency bands. If the bandwidth of a frequency carrier of the communication medium is insufficient to provide for the reception by the entire bandwidth of all users, the entire bandwidth will remain unused. Furthermore, the FDMA technique is an analog type of multiple access scheme, whereby the time slots are of fixed duration and are allotted by time. If there is a need to change the amount of time spent by a user on the communication medium, the user is required to interrupt the communication sessions. A further known multiple access technique is the code-division multiple access (CDMA) scheme. In the CDMA system, for each user a spreading sequence is generated, by which sequence the user is allowed to spread the binary data received from the user over a band of the communication medium, the amount of spreading being determined by the length of the spreading sequence. The spreading sequences for each user are changed in time, so that the binary data assigned to each user are distinguished by the assigned spreading sequences. However, the CDMA technique is a digital type of multiple access scheme, whereby the time slots are of fixed duration and are allotted by code rather than by time. It is an object of the invention to provide a method for enabling multiple access to a communication medium, which method allows a number of users to multiple access the communication medium at the same time, and which allows for different amounts of time for a

What's New In Adobe Photoshop 2021 (Version 22.4)?

I. Field The present disclosure relates generally to communication, and more specifically to techniques for supporting location-based messaging in a wireless communication network. II. Background Wireless communication networks are widely deployed to provide various communication services such as voice, video, packet data, messaging, broadcast, etc. These wireless networks may be multiple-access networks capable of supporting multiple users by sharing the available network resources. Examples of such multiple-access networks include Code Division Multiple Access (CDMA) networks, Time Division Multiple Access (TDMA) networks, Frequency Division Multiple Access (FDMA) networks, Orthogonal FDMA (OFDMA) networks, and Single-Carrier FDMA (SC-FDMA) networks. A wireless communication network may include a number of base stations that can support communication for a number of user equipments (UEs). A UE may communicate with a base station via the downlink and uplink. The downlink (or forward link) refers to the communication link from the base station to the UE, and the uplink (or reverse link) refers to the communication link from the UE to the base station. A UE may measure a quality of a connection with a base station and may send a measurement report to the base station. The UE may measure the quality of the connection based on various reasons. The UE may measure the quality of the connection and may report the measurement to the base station during a random access procedure. In some instances, an uplink radio resource (for example, an uplink time or frequency resource or a code resource) allocated to a UE by a base station for a measurement may be limited. In these situations, the UE may have difficulty in reporting the measurement. It may therefore be desirable to have techniques that support location-based messaging in a wireless communication network. A recent study published in the Journal of Reproduction and Infertility has found that only half of those complaining about pelvic and/or back pain seek out medical advice. Of the women who did seek medical attention, more than half were referred to a specialist and more than a third were given an incorrect diagnosis. What is more, Dr Ravi Kiran, who led the research, found that GPs are guilty of repeating the symptoms. "Over one-third of the women interviewed by their GP were told their symptoms were similar to the symptoms of endometriosis. "This is a common and well-recognised symptom of endometriosis
